Penta WinPSS
Smart Station

The Penta WinPSS simplifies paging and visual messaging with its flexible design and customizable user interface. It is the perfect communications solution for station attendants and security personnel.

Touch Console

LEADER
IN VOICE AND VISUAL SYSTEMS

Designed for transit and transportation paging and visual messaging, Penta's WinPSS is a rugged touch computer-based messaging console. Its flexible design, customizable GUI and extensive options make it a perfect paging and messaging solution for station attendants, security personnel, platform messaging, gate boarding messaging, check-in desk, ticketing desk, and many others. Live, Ad hoc, pre-recorded, and text-to-speech messages are easily directed to the destination zone(s) through the intuitive user interface.

The WinPSS is designed to be a messaging station on Penta's premier WavWriter Passenger Information System. It communicates over standard ethernet to the WavWriter servers but can also be used as an endpoint to the Penta Field Unit Station Controller, allowing the location to be autonomous and not reliant on office servers and remote WAN connections.

FEATURES
